

## **Supplement to EMPI Carburetor Instructions**

- A. The EMPI EPC carburetor requires a maximum of 3.5 PSI fuel pressure. Excessive pressure will have negative effects on the carburetor's performance. If your fuel system produces more than the required 3.5 PSI, it will be necessary to install a regulator between the fuel pump and the carburetor.
  
- B. On some vehicles a return line to the gas tank exists in the fuel system. In some applications the filter in this line has a preset pressure that will restrict the fuel flow to the tank and raise the pressure in the carburetor. This line can be removed or plugged. If you choose to keep this line in the system, make sure it returns before fuel reaches the carburetor and that it has a non-restriction filter in the line.
